Technology: Flywheel Energy Storage

Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm.

It uses a high-speed rotating flywheel to store energy in the form of kinetic energy. When energy is urgently lacking or needed, the flywheel slows down and releases the stored energy.

Flywheel Energy Storage

Flywheel energy storage is defined as a method for storing electricity in the form of kinetic energy by spinning a flywheel at high speeds, which is facilitated by magnetic levitation in an evacuated chamber.

Flywheel Energy Storage (FES) Systems

At its core, an FES system utilizes the kinetic energy of a rotating flywheel. This kinetic energy is converted and stored, ready to be harnessed when needed. The fundamental principle
